

Phishing Detection & Awareness Report

Aim: Phishing Email Detection & Awareness System

Target website: Kaggle (public datasets)

Reported by: M. Pravallika

Overview:

- Phishing is a cyber attack using fake emails.
- Attackers steal passwords and personal data.
- Emails appear genuine to trick users.
- Fake links are commonly used in attacks.
- Suspicious links are used to trick users.

Phishing Indicators:

- Suspicious sender email address.
- Urgent or threatening language.
- Generic greetings like "Dear User".
- Unknown or fake website links.
- Requests for passwords or OTPs.

Phishing Techniques:

- Email spoofing to appear trusted.
- Fake login or verification pages.
- Fear-based warning messages.
- Malicious links in emails.
- Social engineering to manipulate users.

Awareness:

- Verify sender email carefully.
- Avoid clicking suspicious links.
- Be alert to urgent requests.
- Check for unusual email content.
- Learn common phishing signs.

Tools used:

- Phishing Email Dataset for samples.
- Microsoft Excel for email analysis.
- Google Header Analyzer for inspection.
- MXToolbox for email checking.
- PDF tools for report creation.

Email Classification:

- Safe emails from trusted sources.
- Suspicious emails contain warnings.
- Phishing emails request sensitive data.
- Risk level depends on indicators.
- Classification improves email security.

Prevention Measures:

- Verify sender before replying.
- Never share OTP or passwords.
- Avoid unknown links and files.
- Enable Two-Factor Authentication.
- Report suspicious emails immediately.

Conclusion:

This task provided practical understanding of phishing email detection and cybersecurity awareness. By analyzing phishing indicators, suspicious behavior, and email classification methods, it became easier to recognize potential cyber threats. Awareness and careful verification remain essential for protecting users against phishing attacks.
